Oxytocin will be released in response to sepsis, and other form of infections, inflammatory disease and in stress situations. On this basis we conclude that oxytocin is an immunoregulatory hormone and it participates in the acute phase response, it releases growth hormone, and activates the adrenal corticotropic hormone axis in rats.

The oxytocin antagonist prevented pair bonding, though it did not interfere with mating.⁹ . In males, vasopressin was found to play the key role in pair-bonding. When additional vasopressin was administered to male prairie voles, their normal behavior of mate guarding was amplified into aggressive snarling behavior to other passerby males.
