In this paper, we consider the non-conservative compressible two-fluid model with constant viscosity coefficients and unequal pressure function in \mathbb{R}^3 , we study the vanishing capillarity limit of the smooth solution to the initial value problem. We first establish the uniform estimates of global smooth solution with respect to the capillary coefficients $\sigma^\epsilon + \sigma$ and $\sigma^\epsilon - \sigma$, then by ...

Compressible flow (or gas dynamics) is the branch of fluid mechanics that deals with flows having significant changes in fluid density.While all flows are compressible, flows are usually treated as being incompressible when the Mach number (the ratio of the speed of the flow to the speed of sound) is less than 0.3 (since the density change due to velocity is about 5% in that case).
