Direct fired heaters can utilize radiant and/or convection heat transfer sections, and can be configured in many different ways depending on the customers' specific requirements. Due to the flexibility in design, virtually any style of furnace burner can be used in single or multi-burner configurations.

Fired heaters can be classified based on the structural shape of the radiant section and the orientation of the radiant coil. Radiant sections are typically designed as cylinders, cabins, or boxes. Coils can run vertically up and down, horizontally across, or helically through the radiant section.

Introduction to Fired Heaters — Scelerin Heaters

The design of direct fired heaters focuses on simplicity. There are very few moving parts and maintenance requirements are minimal. You'll be able to concentrate on getting the job done comfortably rather than worrying about fixing a heater throughout the day.
