Global Environments Through The Quaternary

Global Environments through the Quaternary delves into the environmental changes that have taken place during the Quaternary: the last 2.6 million years of geological history and time during which humans have evolved and spread across the Earth. Taking the reader through the Pleistocene and the Holocene, the book describes the evidence that has helped us to characterize environmental changes during these two epochs; it then explores the changes captured by more recent meteorological records ...

This finding complements the results of a companion study published in the journal Quaternary Science Reviews, where paleobotanists and paleoclimatologists, led by Irene Esteban, used different lines of evidence to investigate interactions between prehistoric people's plant-gathering strategies and climate and environmental changes over the last glacial/interglacial phase.

Study: Ancient people relied on coastal environments to ...

Humans have a long-standing relationship with the sea that spans nearly 200,000 years. Researchers have long hypothesized that places like coastlines helped people mediate global shifts between glacial and interglacial conditions and the impact that these changes had on local environments and resources needed for their survival.
