In triangulation, you compare the angles of the sides of a triangle formed by three points on your drawing with the same triangle on the subject. This results in accurate proportions. It is the single most important drawing technique to learn. It is rather tedious to start with, but becomes very fast once you are proficient at it.

This is usually done by drawing a true, length diagram. An example of layout using triangulation is the development of a transition piece. The steps in the triangulation of a warped transition piece joining a large, square duct and a small, round duct are shown in figure 2-53. The steps are as follows: 1.

aids the eye to keep within the proper corresponding spaces. That is, each triangle, in the original and in the drawing under way, occupies a distinctive and individual position not observable in the squares.

Whatever errors occur will be noticed as the drawing proceeds, most likely when more of it is drawn in, and also through flicking. The process of triangulation helps you to keep the big-look in mind while you are drawing. This is because it relies on comparing two parts of the image to find a third.

## **Triangulation | Sight-Size**

Triangulation is simply a method of dividing a surface into a number of triangles and transferring them to the development. To find the development of an oblique cone by triangulation, divide the base of the cone in the top view into any number of equal parts and

This method was somewhat time-intensive. I estimate that the method described here required 20% more people-hours on-scene than a Total-station documentation would have required, and about 60 to 80% more time at the computer transferring that information to the final drawing.

The development involve subdividing any ruled surface into a series of triangular areas. If each side of every triangle is true length, any number of triangles can be connected into a flat plane to form a development  
Triangulation for single curved surfaces increases in accuracy through the use of smaller and more numerous triangles.

**TRIANGULATION DEVELOPMENT** It is used for developing transition pieces. Transition pieces are usually made to connect two different forms, such as round pipes to square pipes. These transition pieces will usually fit the definition of a non developable surface that must be developed by an approximation.

## **Civil Engineering Drawing**

The development is commenced by drawing the figure CDFG, and the centre line of this part can be obtained from the front elevation which appears as line CG, the widths being taken from the plan. The next problem is to obtain the true lengths of lines CG and DH and position them on the pattern; this can be done easily by the construction of two triangles, after the insertion of line DG.
