The Community Resilience Estimates (CRE) is a resilience measure that identifies a community's ability to endure, respond and recover from the impact of disasters. Rural counties are far more likely to have greater proportions of high-risk populations. Thirty percent of all rural counties are high-risk compared to 14% of all urban counties.

Rapid urbanisation is transforming relations to tenure security across the region and undermining settlements' resilience to disasters, but there is potential for this trend to be reversed. Urban areas in the Pacific are relatively small in terms of their population size, but they are growing at some of the fastest rates in the world.

Could novel approaches to urban tenure help to reduce ...

Vulnerability of urban areas to natural disasters is hardly restricted to the developing world, of course, as the Japanese earthquake and U.S. experience with Hurricane Katrina attest.

Man-Made Cities and Natural Disasters: The Growing Threat ...

Abstract. In parallel with the observed greater frequency of natural disasters worldwide, there has been an ever-increasing interest in urban resilience and its assessment. Experience obtained in recent extreme events (in particular, earthquakes and floods) has revealed that both the level of preparedness and the response of affected cities were insufficiently high, whereas the recovery process was long and expensive.
